

TREATMENT OF VIRAL HEPATITIS – A, B, C, D, E, G

FOREWORD. *This process has been successfully tested for several years and its effectiveness has also been verified by the global community.* Before reading any of the treatments, you should learn about TENS (Transcutaneous Electrical Nerve Stimulator), which is equivalent to medicine, and see its characteristics by reading the corresponding file contained in this same package. You can purchase it online, just make sure that the "Stimulation Modes" include the option: "Normal or Constant." If this treatment does not cure you, you should see your treating physician.

1/13/2025

Viral hepatitis is an inflammation of the liver caused, among other factors, by a virus, and affects people by causing: weakness, yellow skin and stools, nausea, fatigue, dark urine, etc. ***If you do not rest, it could be fatal.*** Readers who have undergone some electrical treatments will easily understand the reason for designing one for this disease, since it is caused by viruses, and electrical current is a broad-spectrum antiviral that has eliminated the three types of herpes viruses and all pathogenic papilloma viruses with 100%

effectiveness in a single treatment. An important aspect in this case is that the same treatment CAN ELIMINATE ANY OF THE VIRUSES MENTIONED

Figure 1. Position of the liver in the body, as well as that of the corresponding pads to pass through it longitudinally by placing pads on both sides of the ribs, and pads on the front and back to cross it frontally (2).

Similar to previous processes, the treatment focuses on passing through the diseased organ in order to reach the virus and, due to the low impedance or resistance to the penetration of the current in the body, they are penetrated by heating their organs, destroying them and, perhaps, causing their outer membrane to explode as if it were a pressure cooker by increasing the volume of liquid in their body.

PHASE I. Application of a steam session for 30 minutes. The function of this heat phase is to cause the viruses to leave the liver cells so that they can be penetrated by the electric current. During this part, you should have a small towel to dry your body a couple of times during the steam session; you should have sandals ready and the steam chamber with a seat. This product can be easily purchased online from a secure site, such as www.mercadolibre.com or AMAZON, and delivered to your home.

Figure 2. Image of a steam chamber

PHASE II. ELECTRICAL TREATMENT

CURRENT INTENSITY. As in all cases, and in order to avoid using a multimeter, the intensity should be increased gently until the person feels or perceives it and left at that intensity for the entire duration of the treatment.

Treatment time. Treat **for** 15 minutes in each position.

Phases:

1. Apply a heat phase for 30 minutes in order to promote the release of viruses from inside the liver cells (see Figure 2) and immediately move to the examination table or bed to apply the electrical treatment.
2. Place a pair of rectangular pads on both sides of the body, as indicated in position (1) in figure 1, in order to cross the liver horizontally, and stimulate for 15 minutes.
3. Place the pads (2), one on the front of the abdomen, as shown in figure 1, and the other on the opposite side of the back, and stimulate for 15 minutes.
4. Repeat the same treatment on the third day to eliminate any viruses that may have survived the first treatment.

Pad size: Use pads measuring 4 x 8 or 5 x 10 cm.

Electrical stimulation time: 15 minutes per position.
